

## Apply Breakpoints:

Here I set breakpoints on my image preloading code in script.js so execution pauses when the page loads and I can debug early initialization.

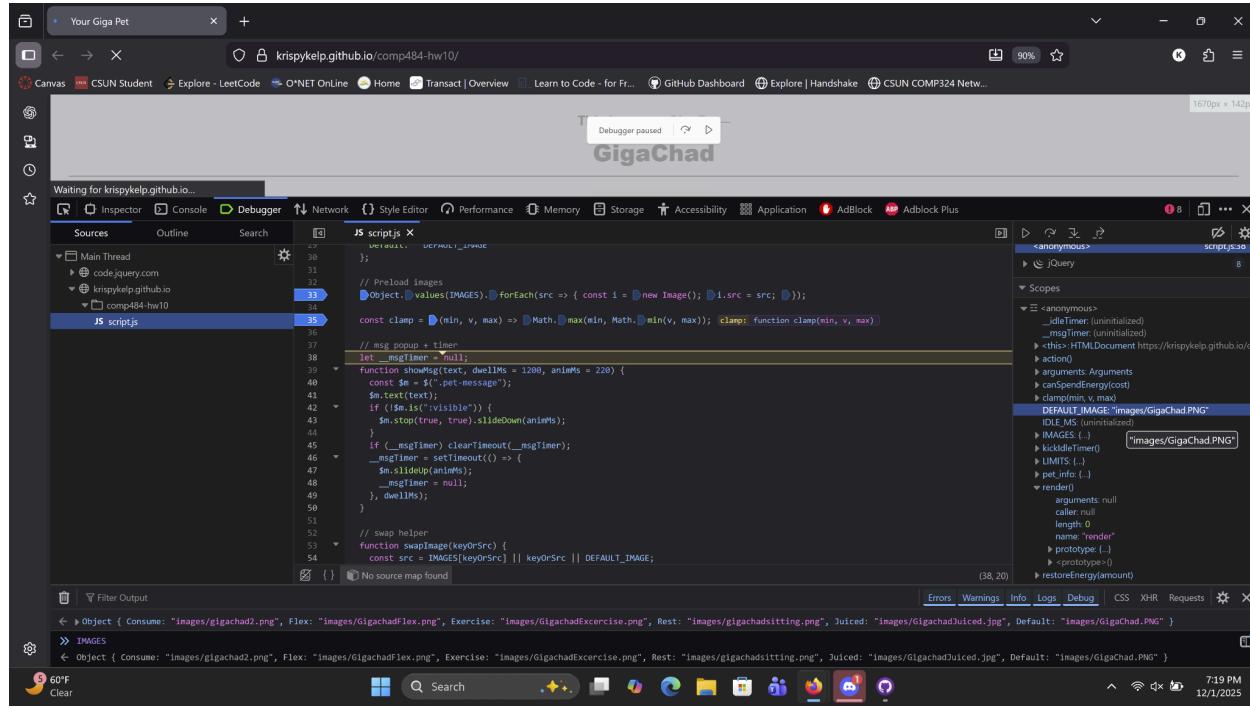

## Paused by reloading:

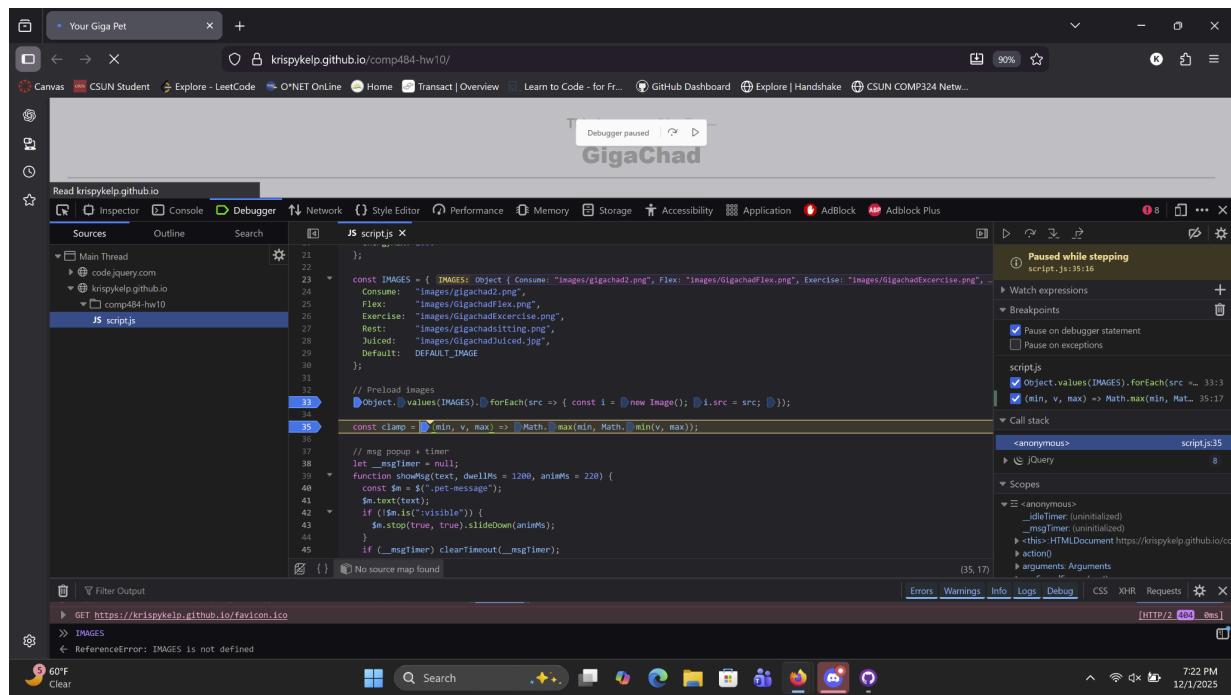

## Inspect Variables using console

While paused, I use the console to print IMAGES and other variables to verify their values.

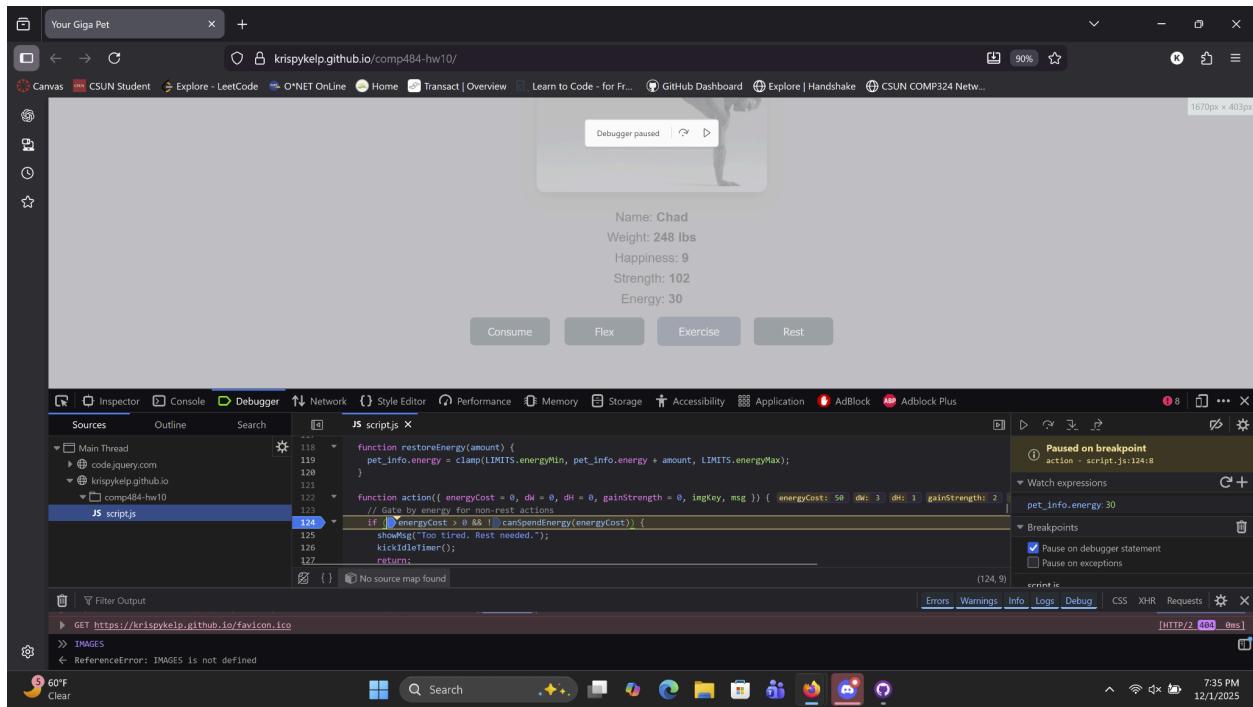

## Stepping:

Stepping through the code line by line to ensure that each line is executed in the correct order, one line at a time

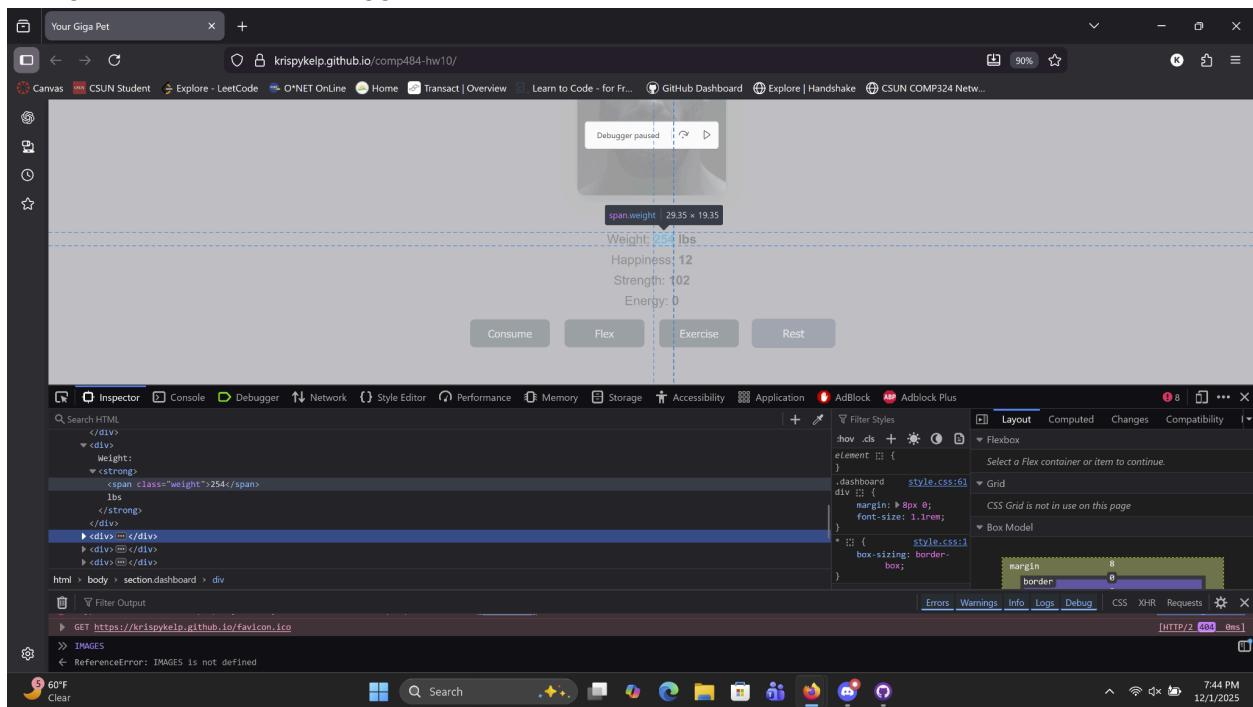

## New Breakpoint, Watch Expression:

Added a watch expression: pet\_info.energy that reflects energy level of pet during operations to show current value and how/when it updates

## DOM Updates with breakthroughs

Using the Inspector, I selected the pet image element and watched src and inline transform style change when actions are triggered

## Inspecting / editing classes:

I edited the class attribute of the pet-image element to add/remove classes like hungry/juiced and see how the CSS changes the pet's size and appearance
